# CSE211-Formal Languages and Automata Theory

## U4L8\_Uncomputable Functions and Rice's Theorem

**Dr. P. Saravanan**

School of Computing

SASTRA Deemed University

# Agenda

- Uncomputable functions
- Property of a Language
- Non-Trivial Property
- Rice Theorem

# Uncomputable Functions

# Uncomputable Functions

A function is **uncomputable** if it cannot be computed for all of its domain

## Definition:

Non-trivial properties of  
recursively enumerable languages:

Any property possessed by some (not all)  
recursively enumerable languages

# Properties of Languages

- Any set of languages is a *property* of languages.
- **Example:** The infiniteness property is the set of infinite languages.

# Properties of Languages - (2)

- As always, languages must be defined by some descriptive device.
- The most general device we know is the TM.
- Thus, we shall think of a property as a **problem** about Turing machines.
- Let  $L_P$  be the set of binary TM codes for TM's  $M$  such that  $L(M)$  has property  $P$ .

# Trivial Properties

- There are two (*trivial*) properties  $P$  for which  $L_P$  is decidable.
  1. The *always-false property*, which contains no RE languages.
  2. The *always-true property*, which contains every RE language.

## Some non-trivial properties of recursively enumerable languages:

- $L$  is empty
- $L$  is finite
- $L$  contains two different strings of the same length

# Rice's Theorem

## Rice's Theorem:

Any non-trivial property of  
a recursively enumerable language  
is undecidable

# Exercise

- Construct the TM that decides  $L = \{w\#w \mid w \text{ belongs to } \{0,1\}^*\}$
